ProfilGate® aqua – design variations

A product of

ProfilGate® aqua – design variations

Tray combinations

Depending on the size of the desired ProfilGate® aqua cleaning field, a single tray or a combination of trays is applied (page 4).

Drain, type A

Sideward drain for laying the drain-pipe in the floor (page 5)

Drain, type B

Downward drain for laying through the floor/ceiling (page 5)

ProfilGate

Tray, type 2
Tray with border profile and insulating flange for sealing to tiles (page 4).

Tray, type 1
Tray with border profile for sealing to floors made of screed, concrete and epoxy resin (page 4).

Tray type

Depending on the type of floor covering, the appropriate tray type has to be selected to assure reliable and durable sealing when installing.

Tray, type 1

This tray type with border profile lends itself for installation in floors made from screed, concrete and epoxy resin.

Tray, type 2

This tray type with border profile and insulating flange is suited for installation in tiled floors. A flat sealing sheet can be fixed on the insulating flange.

Single tray / tray combinations

Single tray

Single trays are deliverable up to size 1,829 mm in width to 2,967 mm in length (driving direction).

Single tray

Figure and dimensions refer to the tray type 1.

2 combined trays

As for a larger cleaning field, two trays have to be combined, each of them equipped with one special joining flange on one side (**connecting trays**).

Connecting tray

Connecting tray

The figure refers to the tray type 1.

3 and more combined trays

Regarding the combination of 3 or more trays, both the first tray and the last one must be equipped with a joining flange (**connecting trays**). Each tray installed in between needs to have the joining flange on both sides (**intermediate trays**).

Connecting tray

Intermediate tray

Connecting tray

The figure refers to the tray type 1.

Drain type

Drain, type A - sideward

This drain type is suitable for drain pipes laid in the floor. The direction of the joining pipe can be selected in steps of 90° each.

Drain, type B - downward

This drain type is appropriate for installation through floors and ceilings. At first, the gully with its adhesive flange is glued into the floor borehole. Then the connecting pipe with seal of the tray is fitted in. Dirt bucket and standpipe make up the odor trap.

Draining position

Each tray is individually customised. This is particularly true for the drain position. The drain cannot be re-located later as it forms integral part of the tray.

Standard drain positions

The drawing depicts eight possible standard drain positions. The driving direction has to be defined in advance since it determines the location of the segments and alignment of the grates with the brush strips.

Individual offset of the drain

Starting from one of the standard positions, the drain can be shifted as required. The position as required enables connecting the drain to an existing waste water pipe.
